Clear Guard Copper Preventive Coating™

Specially Designed COATING for New/Old AC Copper Tubes & Condenser Coil.

STOP GAS LEAKAGE

AREA OF APPLICATION
- Air Conditioners
- Water Coolers
- Deep Freezers
- Industrial Chillers
- Panel AC
- Industrial Application

Product by:
AUTOMOTIVE SOLUTIONS™
Regd. Office: 119, Ground Floor, Old Rajinder Nagar
New Delhi - 110060, INDIA

Ph. : 011-32937026
CLEAR GUARD COPPER PREVENTIVE COATING™

APPLICATION AREAS

PRODUCT APPLICATION GUIDE
FOR INDUSTRIAL APPLICATION
Proper Cleaning. Remove Dust & Dirt.
Mixing Ratio 3:1 Mix Part - A & Part - B Only when Required.
After Mixing of Products Part - A & Part - B. Use with in 20 minutes else product will become hard.
Use BRUSH for Application.
Drying Time 6 to 8 Hrs.

APPLICATION
No coating can perform to expectations if applied to a poorly prepared surface. The metal surface must be free of contaminants such as dust, oil, rust, old finishes, and finger prints. Coating should be done with a minimum of delay after cleaning and precautions should be taken to prevent recontamination. Precautions include working in a low dust environment, handling with white gloves, right mixing of product, use of product within specified pot life (time limit) and applying tarnish inhibitors (chelating agents) to the surface. It must be ensured that in every refrigeration system all the brazing joints should be coated.
Both sides of Cooling Coil & Condenser Coil
Headar joints for cooling coil & Condenser Coils
Suction, discharge & charging joints of the compressor
Capillary/expansion valve joints
Copper Filter/Stainer joints
Accumulator Dryer joints

Reasons of Gas Leakage in Air Conditioning Unit
- Toxic gas and fumes from drains and sewers.
- House near drainage canal (Nallah).
- Industrial pollution.
- Costal areas.
- Acid Rain.

WE INSPECT
WE ADVICE
ABSTRACT

Over the past several years the HVAC industry has experienced a large increase in instances of leaks in the brazing joints central portion of copper tube heat exchange coils. These leaks are characterized as being very small in size and very high in numbers within a single coil. There are many chemical species that can cause these coil leaks, including chlorides from pool chemicals and clotes washing, sulphur from tap water, lubricants and nearby industries, and ammonia compounds from cleaners or nearby industries. However this recent increase in reported coil leaks is being attributed to a newly discovered class of corrosion known as ANT—Nest Corrosion resulting due to Drainage Canal (House Near Nellish), open smelting sewers, coastal areas & Industrial Pollution. Copper Corrosion is the degradation of metal caused by a reaction with the environment, such as oxidation and chemical attack of the metallic surface. Copper is susceptible to attack from sulphur-containing gases. The result is the formation of a non-productive layer on the material surface. Unprotected copper tubing will continue to react with the contaminant and corrode. Under severe, prolonged conditions, the copper tubing continues to corrode until the integrity of the equipment is jeopardized. Unprotected copper in polluted industrial environments can lead to failure of the refrigeration system. Sulphur and nitrogen-based electrolytes are often the cause of accelerated corrosion in industrial environments.

Many HVAC manufacturers, Air Conditioner Manufacturer, distributors, and Contractors may not realize that hundreds of thousands of pinhole leaks have occurred during the last decade from corrosion. The cause is most typically Environmental pollutants, which range anywhere from salt air, to household cleaning agents, pesticides, formaldehyde, building materials, Industrial pollution, sewer pollution and even off-gassing of food. Each of these contaminant sources can initiate corrosion in coil tubing in a year or less when the conditions are right.

Choosing the most appropriate coil coating for the application could save the Project thousands of Rupees and eliminate repeat treatments. Choosing the wrong coil coating could reduce heat transfer capabilities and lead to higher energy bills. 1/100th of an inch of corrosion on an air conditioner condenser coil can increase cost of operation by 30%.

INTRODUCTION TO COPPER PIPE CORROSION

Copper exhibits good resistance to corrosion in urban, marine, and industrial atmospheres. The major factors that control the initial rate of attack on copper are moisture, temperature, and the level of pollution. Soon after exposure of copper to the atmosphere copper oxidize, the bright copper surface takes on a dull tan tarnish. After a few months this tarnish gradually changes to dark brown or black. At a later stage the corrosion products of copper turn green.

Why Clear Guard Copper Preventive Coating™

Clear Guard Copper Preventive Coating is a high performance single step coating to block all corrosion related problems arising due to Industrial Pollutions & environment. This coating is designed to take any type of acid, alkali, solvents, salt & hard water attack on copper & protecting from rusting & gas leak problems.

- Strong resistance to salt water
- Extremely weather resistant
- Superior resistance to wear
- Excellent adhesion properties

Merits of Clear Guard Copper Preventive Coating™

- Protection for copper coil & tubing.
- Tried & Tested for Last 4 Years
- Excellent Adhesion with Rusted Coil.
- Heat Transfer Capability.
- Easy to apply.
- Saves Recurring cost of gas filling.
- Anti Corrosive Properties.
- Fast Drying.
- High Resistance to Acids, Alkali & Solvents.
- Confirms IS Standards.
